### **DETAILED ACTION**

1. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

2. The Search Report and submitted prior art have been considered.

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ashman et al (677) in view of <sup>submitted</sup> Schauder et al (766).

Ashman et al (677) discloses a disk brake with roll back seal 23 but does not include the specific claimed material of the seal.

Claim 1 includes a "piston seal" with 100 parts by weight or more carbon black added to 100 parts by weight of ethylene propylene rubber.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to select the material of the seal of Ashman et al to be carbon black

Art Unit: 3683

with ethylene propylene rubber as taught by Schauder et al in the parts by weight claimed by routine trial and error during the optimization process of arriving at a durable piston seal with good seal and retraction/roll back characteristics consistent with the piston seal art as used in the disk brake art. It would have been obvious to select the particle diameter of the carbon black, nitrogen adsorption, coefficient of linear expansion as well as other modulus of elasticity of the rubber composition to achieve the desired seal characteristics since it is within the general skill of a worker in the art to select <sup>a material</sup> ~~a~~ on the basis of its suitability for its intended use as a matter of design choice.

5. Re claims 8-14, roll back seals are well known. Note Sullivan et al (593), Klein (516), and Karasudani (239).
